Portland Public Schools
Enrollment Forecast
2004-2015

Based on October 2003 Enrollments

Prepared by:
Population Research Center
College of Urban and Public Affairs
Portland State University

March 2004

This document provides the district-wide enrollment forecasts and an explanation of the methods and assumptions used to produce the forecasts. However, the forecasts for individual schools were subsequently revised to better reflect the changes in housing growth in Forest Park ES attendance area (Lincoln HS attendance area), the closing of Columbia Villa (Roosevelt HS attendance area) and the reconstruction of New Columbia. Use the tables in "Addendum to the Portland Public Schools Enrollment Forecast, 2005-2015 and Revised Forecast Tables", August 2004 for the forecasts by school.

SUMMARY

This is the fourth annual report prepared by the Population Research Center (PRC) forecasting future enrollments for the Portland Public Schools (PPS). Previous annual reports were based on October 1999, 2000, 2001, and 2002 enrollments; this report considers October 2003 PPS enrollments.

This report provides a district-wide enrollment forecast, enrollment forecasts for individual schools, and demographic information for Portland Public Schools. The report considers several factors that are likely to affect the school district's enrollments between the October 2003 and 2015, including the future number of births, net migrants, and the proportion of school-age children and youth enrolled in the public schools.

For the district-wide forecast, three scenarios of population and enrollment changes were developed to account for different probabilities of demographic events. Forecasted enrollments were developed for a most-likely, or medium, growth scenario, and for lower growth and higher growth situations. The individual school forecasts are based on the most-likely growth scenario.

For the most-likely growth scenario, it is assumed that the severity of the recent downward trend in enrollment is temporary. The economy is predicted to moderately recover and net in-migration of families with children will increase. Additionally, rates at which enrollment have been decreasing will lessen and eventually stabilize.

Main Findings for the most-likely growth scenario

The main findings from the enrollment forecasts, presented in greater detail later in this report, are as follows:

If recent trends are curtailed, enrollments in PPS are forecasted to continue to decrease, but at rates that dampen during the 2004-2011 time period. A slight increase in enrollment is expected during 2011-2015. During the entire forecast period, however, there will be an overall public school enrollment averaging about 300 students each year between October

2003 and 2015. These annual decreases will reduce total enrollments from 49,029 students in the 2003-04 school year to about 44,373 in the 2015-2016 school year. This represents a decrease of about 7 to 8 percent in Portland Public Schools enrollments over the span of 12 years.

Although assumptions about recent trends support a forecast for continuing decreases in school enrollments before stabilizing, there are variations in the forecasts for the size of the declines and the timing at which enrollments might stabilize. Under the most-likely forecast scenario, there will be about 3,600 fewer students enrolled in PPS in 2015 than are currently enrolled. This decrease represents a 7.6 percent decline over the span of 12 years, or an average of 300 fewer students per year.

Changes in enrollment for all grade levels - Kindergarten through 2nd, 3rd through 5th, 6th through 8th, and 9th through 12th - are expected to follow a similar pattern as total enrollment. The magnitude of change and occurrence of change will vary, however. Enrollments in the lower grades will rebound at a faster pace than enrollments in the higher grades. Enrollments in all grades levels except 9-12 will see increases by the end of the forecast period. Enrollments in grades 9-12 will fluctuate throughout the period, and are expected to start to stabilize near the end of the period.

Cautionary Notes

Given the severity of recent PPS enrollment declines, several caveats should be kept in mind when interpreting the enrollment forecasts in this report.

First, the PPS enrollment projections represent a forecast derived from assumptions representing PRC's best expert judgement as to the possibilities of what future conditions may be. It is not possible to judge at this time which of the assumptions or combinations of assumptions may best approximate future enrollments. The next three or four years will reveal whether the modeled demographic trends are likely to occur. If different conditions arise, then it would be appropriate to revise the enrollment projections, taking into account new assumptions.

Second, variations in forecasts become larger in the long run. Most of the students who will enroll in Portland Public Schools next year are currently enrolled in the schools this year. This helps to make a more accurate forecast in the short term. But, as years go by, enrollments depend increasingly on assumptions about the numbers of school-age children and youth that move into and out of the school district and the number of births that occur in the district. We therefore become less confident about enrollment forecasts over longer periods of time.

Finally, there is a temptation in interpreting forecasts to ask: "Which is the correct forecast?" Asking such a question implies that there is need to pick one forecast at present and then base future plans on it. The more appropriate use of this report is to consider that there is likely to be some variation around the most-likely forecast in this report and that we will want to update them as future conditions evolve. Instead of "picking and planning" right now for one outcome over the next twelve years, we urge school officials and the public to "monitor and manage" the changing conditions that will affect future school enrollments. The most-likely enrollment forecast presented in this report can best serve as a guideline in this process of monitoring and managing.

INTRODUCTION

This report presents the results of a study conducted by the Population Research Center (PRC) to address the long-range planning needs of the Portland Public Schools (PPS). This report considers recent demographic changes experienced in the District and provides annual district-wide enrollment forecasts by grade for the PPS from 2004 to 2015. Also included are enrollment forecasts for selected grade levels (K-2, 3-5, 6-8, and 9-12) for each year from 2003 to 2015 for individual schools within the PPS boundaries.

For the district-wide forecasting, three scenarios of population, housing, and enrollment changes were developed to account for different probabilities of demographic events. Expected future enrollments that result from the most likely population trends in the District are presented in this report along with two additional district-wide enrollment forecasts based on lower and higher growth scenarios. The three scenarios presented here differ from those developed for earlier forecast reports. Each scenario is based on alternate future population growth assumptions predicted for the area in and around Portland Public Schools.

The report covers the following topics:

District Demographic Trends. A description of recent demographic trends, and factors that influence population and enrollment changes in the District, including fertility, migration, race/ethnicity, and housing growth. Also included in this section is a description of some additional factors that influence enrollment changes – capture rates, and private and home schooling trends.

Enrollment Trends. A brief description of historical and current enrollment patterns in the District.

Population Growth Assumptions. A description of the assumptions used in the low, medium, and high growth District forecasts.

The Most-Likely, and Low and High District Enrollment Forecasts (District-Wide Results). The results are presented along with an analysis of predicted enrollment changes.

Demographic Trends in High School Cluster Areas. A description of the significant population, housing, and enrollment trends that are specific to the individual geographic areas of the high school clusters.

Methods and Data Employed for District Forecast. A description of the population and enrollment model and data sources used for the district-wide forecast.

Methods and Data Employed for Individual School Forecasts. A description of the model and data used for these forecasts.

Appendices 1 and 2. Detailed District-wide and school forecast tables are presented.

Appendix 3. Detailed data sources are described.

DEMOGRAPHIC TRENDS IN AND AROUND PPS: FACTORS AFFECTING PPS ENROLLMENTS

Population

It is estimated that the total population in PPS reached approximately 439,200 in 2003. PPS, by nature of its location within Multnomah County and the City of Portland, follows similar trends as the two larger areas. The population in PPS represents about 83 percent of Portland's population and 66 percent of Multnomah County's.

Since at least 2000, it is estimated that Portland's population has been increasing by about an average of 5,300 persons annually, capturing 91 percent of the total population growth in Multnomah County. After several years of slackened growth, the growth rate of the total population in Portland was estimated to have increased last year raising the average annual growth rate to about 1 percent since 2000. The rate of increase of the school-age population in Multnomah County during recent years, however, has typically been lower than the rate for the total population, and lower than the rates in surrounding counties. Despite overall population increase in Portland, it is estimated that growth rates for the school-age population has declined as it has in the County.

Both the city of Portland and Multnomah County have seen similar trends for children's population by age group during 1999-2002. The population of children ages 0-4 have increased slightly, while children ages 15-19 have decreased. Children ages 5-9 have fluctuated and children ages 10-14 have remained fairly stable. It is reasonable to assume that similar trends have occurred in PPS, too.

The population of Whites in both Portland and Multnomah County has been decreasing in the last several years and the ethnic minority population has been increasing. Since at least 1999, Hispanics and Asians have been increasing in both areas, while the Black population has been decreasing in the city and increasing in the County. The Asian population has been increasing at a faster pace in the city than in the County. The Native American population has remained stable.

Fertility and Births

The total fertility rate in PPS was about 1.75 in 2000. Fertility rates in the District are assumed to have remained stable as there have been no significant changes in the annual number of births. Since 1998, there have been between 5,400 and 5,600 births in the District annually. Thus far, any increases in fertility from women in racial/ethnic groups associated with higher fertility moving into the District have been offset by others postponing child-bearing or deciding not to have children.

In 2002, the most recent year for which data are available, 68 percent of all births in the District were White, 14 percent were Hispanic, 8 percent were Black, and 9 percent were Asian or Pacific Islander, and 1 percent were Native American. Babies who were reported to be of any other racial group represented less than one percent of the total births. Since at least 1998, the number of White births and the number of Black births have been decreasing. Hispanic and Asian births have been increasing, while Native American births and births of those in the 'other' ethnic minority group have been stable.

Housing and Households

During 1998 to 2003, over 5,000 new housing units have been added within the PPS district boundary. The addition of multi-family units, such as apartments and condominiums, has outnumbered the increase of single-family dwellings during this period Annually, during the time period, an average of 1,000 new housing units have been added within PPS. Despite continued housing growth in the District, it appears that fewer families with school-age children are moving in as not so child-friendly housing is being constructed and less permanency is associated with apartment living.

Most of the land area within the Portland Public Schools area has been developed. New residential construction has been "in-fill" developments and there have been some conversions of commercial structures for residential housing. As of August 2003, the number of vacant taxlots in PPS that are zoned as residential is approximately 10,000. This

number represents about 6.9 percent of all residential land in PPS. The number of possible housing units that may built on this land in the future could be larger as multi-family structures may be built on one taxlot (see map in Appendix 4 for location of vacant residential lots).

Portland's average number of persons per housing unit is estimated to be 2.47 for single-family housing units (the lowest of all surrounding sizable cities in the metropolitan area) and 1.64 for multi-family units (the lowest after Lake Oswego and West Linn). Portland's low average number of persons per housing unit is another indication of households with few or no children.

Migration

Clues about population migration patterns were detected by examining annual student enrollment data that contain characteristics of students such as race/ethnicity, and residency. Movement in and out of the District of students was analyzed.

In recent years there has been a decline in the numbers of students moving into the District but the numbers moving out have been more constant. While an overall increase in the numbers of students moving out has not been observed, the result is still a net loss of students because the students who have been leaving the District are not being replaced by newcomers as they were in previous years.

The majority of students moving out of the District are White, and the number of minority students (mostly Hispanic) that had been moving into the District to offset student losses in previous years has declined. Additionally, there has been an increase in the number of minority students (mostly Blacks) moving out of the district.

Most of the students who have been transferring in and out of the District have been residing in rental housing. Due to the lack of permanency associated with apartments and other rental housing, in times when the economy is in recession and unemployment rates

are especially high in the city, more renters than home-owners seek better-value housing and jobs elsewhere.

For a more detailed description of the results from the analysis of the student enrollment data and an explanation of possible causes for the recent accelerated decline of PPS enrollments, please refer to the report entitled *Anatomy of the Losses in Portland Public Schools Enrollment* prepared by Richard Lycan for PPS, dated February 2004.

PPS Capture Rates, and Private and Home School Enrollment

Capture rates, the rates that reflect what percentage of children attend local public education, was about .84 in 2000. It is estimated that the capture rates in 2003 haven't changed much since 2000. This means that 84 out of 100 school age children residing in the District attend PPS schools. In 2000, the capture rate for grades 3-5 was the highest at .87, followed by grades 6-8 with a rate of .85. The capture rate for high schoolers is about .84. The lowest rate characterizes K-2 students at .82.

The number of students that reside outside of the District and attend PPS schools fluctuated between 750 and 900 students during 1998 to 2003. In 2003, there were 791 out-of-district students attending PPS schools. Over 50 percent these students attended high school, 13 percent were enrolled in middle school, and 36 percent were in elementary school.

About 30 private schools were surveyed in the Portland metropolitan area to evaluate overall trends of private school attendance. Based on the survey responses, no significant changes were found in the number of students residing within the PPS boundary attending private school in recent years.

Analysis of data from the Oregon Department of Education suggests that growth rates of private school enrollment in the Portland metropolitan area are not as high now as they were in the mid-1990s, and no substantial changes were noted during the past year.

For students being home schooled, the trend appears to be similar to those enrolled in private school. Although the annual rate of growth of students in home school has fluctuated historically, there seems to be a general slowing trend in recent years in Multnomah County.

The percentage of school-age children in home school in Multnomah County during 1998 to 2000 was around 1.5%. Multnomah County typically has a smaller percentage of school-age children in home school than Washington County or the State of Oregon.

Approximately 1,800 children were reported to be home schooled in Multnomah County in the 2000-2001 school year. During the same period approximately 1,000 students residing in PPS are estimated to have been in home school.

From available data, the numbers of children attending private or home school do not significantly impact changes in PPS enrollment, nor do the number of PPS students residing outside of the District.

PPS Enrollment Trends

The school district includes 59 elementary schools, 17 middle schools, 10 high schools, and a variety of special schools and programs. The configuration of the grade levels for most elementary schools is kindergarten to grade 5; however, eight elementary schools have pre-kindergarten programs. Middle schools consist of grades 6 to 8. High schools include grades 9 to 12. Several schools include special programs and many schools include some students who are not classified in a specific grade. All special programs and unclassified students, however, are included in this study.

During 1990 to 1996, PPS experienced enrollment increases during most years with an average annual increase of about 400 students. Beginning in 1997 PPS began to see constant yearly decreases in enrollments. The average annual decrease from 1997 to 2001

was about 600 students. Between 2001-2002, enrollment decreased by 1,200 students and between 2002-2003 by 2,400. District enrollment shrank from 54,038 in 1997 to 48,029 in 2003 with an average annual decrease of about 1,000 students which represents a 2.0 percent yearly decline.

Between 1998 and 2002, the greatest annual losses consistently were at the elementary grade levels. In 2003, however, the greatest decrease was experienced at the middle school and high school levels.

The explanation for the overall enrollment declines which began in 1997 is detailed in a report prepared by the Population Research Center entitled *Changing Times, Changing Enrollments: How Recent Demographic Trends are Affecting Enrollments in Portland Public Schools.* Causes of the accelerated enrollment in 2002 and in 2003 are analyzed in the report entitled *Anatomy of the Losses of Portland Public Schools Enrollment* by Richard Lycan. The main conclusions about the possible factors contributing to the declining enrollments in PPS as outlined in the reports are:

- First and foremost, public school enrollments have declined in recent years primarily because there have been sizeable decreases in the number of students entering kindergarten and the early elementary school grades. Smaller numbers of entering students are, in turn, the result of substantial reductions in the number of births -- reductions that began in 1991. Because there were fewer births in the early 1990s, fewer students enrolled in school in the late 1990s.

- The number of births continued to decline throughout the 1990s. Declines in school enrollments starting after about 2002 are partly attributed to the lower number of births in the second half of the 1990s than in the early 1990s. This decline in births, however, has not been the main cause of the *accelerated* decreases in PPS enrollment in 2002 and 2003.

- Net out-migration of school-age children appears to have increased in the late 1990s, further reducing enrollments.

- There is conflicting evidence from public, private, and home schooling data on changes in public school capture rates (the proportion of school age children enrolled in Portland Public Schools). Available data, however, suggest that decreases in capture rates have been slight and have not been a major determinant of public school enrollment trends.

- Increased international migration into the Portland metropolitan area has ameliorated the decline in enrollments by adding several thousand foreign-born students to the Portland Public Schools. Immigrant couples are contributing an increasing number of births to the population. Births to immigrants partially counterbalance fertility declines among native-born residents.

- More recently, there has been a decrease in the numbers of minority students in PPS.

- Recently there has been a decrease of in-migration to PPS rather than an increase of out-migration from PPS.

Enrollment by race/ethnicity

Based on 2003 enrollments, White students represent about 60 percent of the total PPS enrollment. Blacks represent 16 percent, Hispanics, 11 percent, Asians 10 percent, and Native Americans about 2 percent. White enrollment has decreased in recent years, while the share that Asians and Hispanic represent has increased. Hispanic students in PPS are growing at the fastest pace. The share that Black and Native American students represent has decreased slightly.

SPECIFIC DEMOGRAPHIC ASSUMPTIONS FOR THE ENROLLMENT FORECASTS

The population of an area is determined by the number of births and deaths that occur in the same area, and number of net migrants moving in or out. The population in a given time period is illustrated in the following equation:

> Population in 2000 = Population in 1995 + Births during 1995 to 2000 – Deaths during 1995 to 2000 +/- Net Migration during 1995 to 2000

The number of net migrants is influenced by factors such as housing availability and the economy. In addition to an area's population characteristics, capture rates also determine public school enrollment.

All three scenarios for which PPS enrollment forecasts were developed assume that current housing growth, mortality, and capture rates will continue relatively unchanged for the next 12 years. It is also assumed that fertility in all 3 scenarios will remain about the same until 2010. At that time, under the high growth scenario, it will slightly increase from its present level of about 1.75 to 1.85.

Migration rates, a more difficult demographic factor to estimate than the other factors, are assumed to be the thrust of PPS enrollment changes. Net migration in PPS during 2004 to 2015 is predicted to fluctuate slightly.

<u>Assumptions of Demographic Change for Each Growth Scenario</u>

The economy is a major driving force influencing in and out-migration of population. Local and regional economists concur that the economic climate in the Portland metropolitan area will indeed improve, but when it will improve is not certain.

Three growth scenarios (low, medium, and high) are utilized for the District-wide enrollment forecasts. The different scenarios are based on predictions of demographic trends in the PPS area and how quickly the economy will recover.

The recent dramatic enrollment declines that have occurred in PPS are not anticipated to continue in the future. The demographic trends that have led to decreasing enrollments are expected to lessen in magnitude. The population growth assumptions in all 3 scenarios developed for this forecast have a milder impact on future PPS enrollments than have been observed in the past two years. The differences between the scenarios' assumptions represent varying magnitudes curbing the recent trends of high net out-migration.

As mentioned above, rates of population and enrollment growth in the District are mainly influenced by migration. All three scenarios for which forecasts were prepared consider a change in overall population migration patterns with attention given to migration of racial/ethnic groups. It is assumed for each scenario that the migration pattern of individual racial/ethnic groups will change and there will be a reversal in the downward trends of growth rates experienced by most population groups. The effect of migration for individual racial/ethnic groups on total migration rates was utilized as a guide when predicting migration for the total population. Because Whites represent the largest proportion of total enrollment in PPS, their migration patterns have the greatest influence on how enrollments change. The next most influential groups are the Black and the Hispanic populations, followed by Asians. The migration patterns of Hispanics and other minority populations vary more than the patterns of the White population in the three scenarios, however.

The **medium growth scenario** assumes that the current economic situation will moderately rebound and thereby curb the downward net out-migration trends of families with children recently experienced by the District. Although decreases in enrollment are still expected during the next several years, the annual loss of students will not be as great. Net out-migration rates will decrease with a moderate recovery of all racial/ethnic population groups, and toward the end of the forecast period net migration rates will stabilize.

The demographic trends of the past four years (1999 to 2003) are assumed to have more bearing on future enrollments in the **low growth scenario**. In this scenario, only a slight

recovery of all racial/ethnic groups is implied and a net out-migration of families with children is continued. But because the rates of decline during 1999-2001 were not as pronounced as during 2001-2003, the rate of the loss of students seen last year is tempered and the change in annual enrollment is less dramatic during 2004 to 2015.

Under the **high growth assumption**, the downward trends of recent years are assumed to rebound at a quicker pace than in the medium scenario, and a stronger recovery of the economy leading to in-migration of families with children in all racial and ethnic groups is anticipated. In this case, smaller enrollment decreases are forecast for the District from 2004 to 2010. By 2011, in this scenario, increases in enrollment are seen.

DISTRICT-WIDE ENROLLMENT FORECAST

Under the assumptions for population growth considered here, decreases in PPS school enrollment will continue but will stabilize during the forecast period. The rate and timing at which enrollments will begin to recover and the magnitude of the recovery differ in each of the three forecast scenarios.

Under all three growth assumptions, students in the elementary grade level are anticipated to rebound at a faster pace than students in middle school, and those in middle school will rebound faster than those in high school. High school enrollment will account for most of the losses seen at the District-wide level.

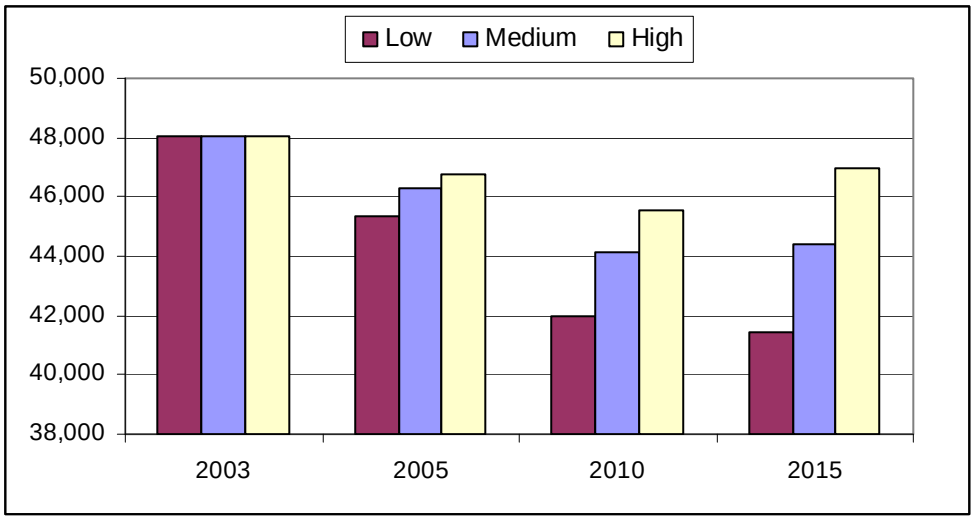

Since 1997, the greatest average losses were seen in elementary school. Because fewer students at these ages are moving through the system, high school enrollment are restrained. Increases of younger students expected in the District will affect high school enrollment after the forecast period.

Results

PPS enrollments in all three scenarios are predicted to decrease until at least 2010 (see Figure 1). As 2015 approaches, increases in enrollment will be seen under the medium and high growth assumptions, but enrollment will continue to decrease throughout the forecast period in the low growth scenario.

The differences between the scenarios' assumptions are in the magnitude of curbing the recent trends of net out-migration and recovery of higher in-migration. The difference between the low, medium, and high assumptions becomes more pronounced after a few years. In the immediate two or three years, there are relatively smaller differences between the three assumptions. By 2015, the differences are greater.

Figure 1. Current and Projected Enrollment: Three Growth Scenarios

Tables 1, 2, and 3 below display the enrollment forecasts for summarized grade levels for each of the three scenarios. More detailed tables are located at the end of this report in Appendix 1. Each scenario is discussed in more detail below.

Medium Growth (most-likely)

The **medium growth assumption** indicates that overall school enrollments will decrease slightly from present levels of 48,029 to 44,373 in 2015, a decrease of 3,656 students. The decrease in enrollment for the district represents a 7.6 percent change distributed over 12 years. On average, total enrollment will decrease by 305 students per year, which is less than a one percent yearly decline.

Enrollments in all grade levels continue to decrease in the immediate years. Recovery of students is eventually seen at all grade levels except high school. Students in the grade levels that do recover will be at different rates. Recovery time is faster for the lower grades, and slower for middle school enrollment.

Decreases in K-2 enrollments will be seen in the next couple of years. However, under the medium growth assumption, beginning in 2006, students enrolled in the lower elementary grades will see annual increases that will continue throughout the rest of the forecast period. Overall, from 2003 to 2015, enrollment in grades k-2 will increase by 5.5 percent.

Students in higher grade levels will take longer to stabilize. Enrollment in grades 3-5 will begin to see slight increases starting in 2011 so that by 2015 there will be only 172 fewer students than in 2003. By 2012, middle school enrollment is predicted to increase, but in 2015 there will be an overall loss of almost 1,000 middle school students from 2003. High school enrollment will see the greatest declines – over 2,700 fewer students are expected to attend PPS high school in 2015 than in 2003.

Table 1. Medium Growth District Enrollment Forecast

Medium Growth Scenario	**2003**	**2005**	**2015**	**2003-2015 Change**		**Average Annual Change**	
				Number	**Percent**	**Number**	**Percent**
Elementary, K-2	10,906	10,548	11,509	603	5.5%	50	0.4%
Elementary, 3-5	10,786	10,553	10,614	-172	-1.6%	-14	-0.1%
Middle School, 6-8	10,375	10,017	9,382	-993	-9.6%	-83	-0.8%
High School, 9-12	14,193	13,671	11,459	-2,734	-19.3%	-228	-1.8%
Ungraded	1,769	1,502	1,409	-360	-20.4%	-30	-1.9%
Total	48,029	46,290	44,373	-3,656	-7.6%	-305	-0.7%

Low Growth

Under the low growth assumption, the decline in total enrollment from 2003 to 2015 is almost 14 percent, with an average annual rate of -1.2 percent. This decrease represents a loss of 6,576 students, or an average loss of 548 students annually.

Enrollment in grades K-2 are expected to increase slightly during the forecast period. Enrollment in all other grades are predicted to decrease. In grades 3-5, it is predicted that by 2015 there will be 764 fewer students. Middle school will see more dramatic losses during the forecast period with 1,740 fewer students. Even greater declines are expected at the high school level with a decline of 26.5 percent, or 3,764 fewer high school students in 2015 than in 2003.

Table 2. Preliminary Low Growth District Enrollment Forecast

Low Growth Scenario	**2003**	**2005**	**2015**	**2003-2015 Change**		**Average Annual Change**	
				Number	**Percent**	**Number**	**Percent**
Elementary, K-2	10,906	10,484	11,051	145	1.3%	12	0.1%
Elementary, 3-5	10,786	10,336	10,022	-764	-7.1%	-64	-0.6%
Middle School, 6-8	10,375	9,689	8,635	-1,740	-16.8%	-145	-1.5%
High School, 9-12	14,193	13,366	10,429	-3,764	-26.5%	-314	-2.6%
Ungraded	1,769	1,457	1,315	-454	-25.6%	-38	-2.5%
Total	48,029	45,330	41,453	-6,576	-13.7%	-548	-1.2%

High Growth

In the high growth scenario, only 1,050 fewer students are predicted to be enrolled in PPS in 2015 than in 2003. This minor loss of students over the 12-year period represents a 2.2 percent decline, with an average annual rate of about -0.2 percent. Total enrollment begins to slightly increase in 2011 and enrollment in 2015 is higher than in 2005.

Over 1,400 additional students are expected to attend PPS in grades K-2 in 2015. More students in grades 3-5 are also anticipated to be enrolled in PPS in 2015 than in 2003; 538 more students in grades 3-5 are predicted to attend PPS elementary schools in 2015. Overall decreases for middle school and high school of 546 and 2,193 respectively, are foreseen from 2003 to 2015 under the high growth scenario.

Table 3. Preliminary High Growth District Enrollment Forecast

High Growth Scenario	2003	2005	2015	2003-2015 Change		Average Annual Change	
				Number	Percent	Number	Percent
Elementary, K-2	10,906	10,681	12,333	1,427	13.1%	119	1.0%
Elementary, 3-5	10,786	10,662	11,324	538	5.0%	45	0.4%
Middle School, 6-8	10,375	10,122	9,829	-546	-5.3%	-46	-0.5%
High School, 9-12	14,193	13,799	12,000	-2,193	-15.5%	-183	-1.4%
Ungraded	1,769	1,524	1,493	-276	-15.6%	-23	-1.4%
Total	48,029	46,788	46,979	-1,050	-2.2%	-87	-0.2%

HIGH SCHOOL CLUSTER AND PPS ENROLLMENT TRENDS

Different growth patterns occur in different parts of the District. Each of the nine high school clusters (HSCL) was examined for any significant demographic characteristics or changes in population or housing growth that might influence individual school forecasts. Factors that were analyzed are births, racial/ethnic composition, building activity (including amount of available vacant land that is zoned residential and future planned developments), school enrollment trends, and drop-out rates. It should be noted that enrollment trends of individual elementary school attendance areas commonly differ than the demographic trends of the HSCL they are located in.

Population

The most recent year for which population data are available is 2000 (census data).

In 2000, Lincoln High School Cluster captured the largest share of the District's total population, followed by Franklin and Cleveland, while Roosevelt, Marshall and Grant had the smallest share. Of the school-age population, however, most children resided in Jefferson and Madison, and the least lived in Lincoln and Grant. HSCLs with a higher share of the District's total population than school-age population indicate that there is a larger share of persons without children than in other HSCLs.

Table 4. HSCL Share of PPS Population

High School Cluster	Proportion of District Population in 2000	Proportion of Population, Ages 5-19 in 2000
Cleveland	12.4%	10.0%
Franklin	12.5%	10.8%
Grant	9.5%	9.7%
Jefferson	11.7%	13.6%
Lincoln	13.5%	9.1%
Madison	11.3%	13.0%
Marshall	9.4%	11.4%
Roosevelt	7.8%	10.6%
Wilson	11.8%	11.8%

Housing

Most of the housing growth during the 1998-2003 period occurred in Lincoln, Marshall and Wilson HSCLs. The fewest number of units were added in Grant HSCL (see Table 5). More than half of the new housing constructed in all the high school clusters, except Roosevelt and Marshall, were multi-family units. In Cleveland, new multi-family dwellings accounted for almost 75 percent of the new residential units.

During 1998-2003, most new residential construction in the District occurred in 2001-2003. More new housing units were added to Franklin, Lincoln, Madison, Marshall, and Roosevelt HSCLs than were added during 1998-2001.

Table 5. Housing Units Added By HSCL

Total Units Added	July 1998-June 2001	July 2001-June 2003	July 1998 – June 2003	Percent Multi-family Units
Cleveland	212	54	266	74%
Franklin	64	216	280	54%
Grant	101	52	153	68%
Jefferson	325	196	521	62%
Lincoln	654	1,091	1745	68%
Madison	92	210	302	60%
Marshall	304	429	733	46%
Roosevelt	202	290	492	24%
Wilson	402	211	613	55%
District Total	2,356	2,749	5,105	58%

Source: Building Permit Data, Metro Data Resource Center, 2003

As of August 2003, Lincoln HSCL has the largest number of vacant taxlots that are zoned residential followed by Wilson (see Table 6). The fewest residential taxlots that are vacant are located in Grant HSCL (see map in Appendix 4).

Table 6. Vacant Taxlots that are Zoned Residential by HSCL

HSCL	Number of Vacant Residential Taxlots	Percent of All Residential Taxlots in the HSCL
Cleveland	772	4.7%
Franklin	701	3.7%
Grant	440	3.0%
Jefferson	980	5.5%
Lincoln	2,937	17.0%
Madison	560	3.5%
Marshall	836	5.9%
Roosevelt	836	7.7%
Wilson	2,053	10.1%
District Total	10,115	6.9%

Births

Of the total number of births in the District during 1998-2002, most occurred in the Jefferson, and Madison HSCLs. They represented about 14 percent and 13 percent of all births in the District respectively. The fewest births, less than 10 percent of district births, occurred in Lincoln and Grant (see Table 7).

Table 7. Births in PPS, 1998-2002

HSCL	Births	Share of District Births
Cleveland	3,116	11.3%
Franklin	3,418	12.3%
Grant	2,664	9.6%
Jefferson	3,838	13.9%
Lincoln	2,212	8.0%
Madison	3,544	12.8%
Marshall	3,307	11.9%
Roosevelt	2,805	10.1%
Wilson	2,795	10.1%
District Total	27,701	

Cleveland and Grant HSCLs saw the greatest decline in births between 1998 and 2002. Lincoln, Marshall, and Wilson were the only HSCLs to experience an increase during the same period (see Table 8).

It should be noted that the number of births fluctuate from year to year and that an HSCL with an increase in births between two years could easily show a decrease for a different two years during a similar time period.

Table 8. Change in PPS Births, 1998-2002

HSCL	1998 Births	2002 Births	Change
Cleveland	668	569	-14.8%
Franklin	692	682	-1.4%
Grant	582	525	-9.8%
Jefferson	777	727	-6.4%
Lincoln	415	478	15.2%
Madison	684	681	-0.4%
Marshall	653	688	5.4%
Roosevelt	604	557	-7.8%
Wilson	558	581	4.1%
District Total	5,633	5,488	-2.6%

Ungraded Students

The number of ungraded students has been increasing since 1998. In the 2003-2004 school year, ungraded students represented 3.7 percent of the PPS total enrollment, or 1,769 students. The highest percentage of ungraded students attend high school (44 percent), 31 percent attend middle school, and 25 percent are enrolled in elementary school. Most ungraded high school students attend Franklin, Madison, or Roosevelt high schools. The majority of ungraded middle schoolers are enrolled in Ockley Green and Beaumont. Ungraded students at the elementary level are more distributed amongst the elementary schools, but the largest numbers attend Whitman, Rose City, Bridger, Sitton, and Kenton.

Students Attending their Neighborhood Schools

PPS students in grades K through 12 that are not in special programs and reside in Lincoln or Wilson HSCLs are most likely attend their neighborhood school than those who live in other HSCLs in the District. In both areas, over 90 percent of the students in all grade levels attend their neighborhood school.

The percentage of PPS students residing in Jefferson and Madison HSCLs that attend their neighborhood schools are the lowest in the District. The lowest percentage of PPS students in grades K-3 and 3-5 that attend their neighborhood school reside in Madison HSCL. PPS

students enrolled in their neighborhood middle school and high school are lowest in Jefferson.

A higher percentage of students in the elementary grade levels are enrolled in their neighborhood schools than in the other grades. High school students attending the schools in the neighborhood they reside in represent the lowest percentage. Only 46 percent of PPS students in grades 9-12 residing in Jefferson HSCL are enrolled in Jefferson High School, and 60 percent of high school students residing in Marshall HSCL attend Marshall High School.

Table 9. Percentage of PPS Students Attending their Neighborhood School*

HSCL	K-2	3-5	6-8	9-12
Cleveland	85.8%	88.6%	85.8%	82.6%
Franklin	82.0%	78.6%	85.5%	69.6%
Grant	87.2%	84.8%	84.3%	85.0%
Jefferson	78.5%	79.4%	50.3%	46.0%
Lincoln	96.8%	97.8%	95.3%	94.5%
Madison	72.5%	76.6%	70.4%	66.2%
Marshall	84.1%	84.8%	81.7%	60.1%
Roosevelt	79.4%	86.1%	89.7%	77.4%
Wilson	92.0%	91.1%	94.7%	91.1%

*This table does not include students in special programs or un students.

PPS Students Residing Outside of the District

Currently, 791 PPS students reside outside of the District. Since 1998, the number of PPS students residing outside of the District has fluctuated between 780 and 900 students. They represent about 1.5 to 1.7 percent of the PPS total enrollment each year. In the 2003-2004 school year, more than half, or 404 students, attend high school, 13 percent or 101 students attend middle school, and 286 students (36 percent) are enrolled in elementary school.

Most elementary level students living outside the District attend Sunnyside, Richmond, and Woodstock elementary schools or are enrolled in special programs. Mt. Tabor and Binnsmead Middle Schools attract most students outside of the district, while Benson and Marshall are high schools of choice for outside students.

Historical Enrollments of PPS Students Residing in HSCLs

In the past, the largest share of PPS students resided in Jefferson HSCL. In October 2003, however, most students were residing in Marshall HSCL. The smallest share of PPS students reside in Lincoln HSCL followed by Cleveland HSCL. (see Table 10).

The number of students residing in Marshall and Lincoln HSCL increased from 1998 to 2003. Students residing in the remaining HSCLs have decreased during the same period. Jefferson and Grant HSCLs have seen the largest declines. Each lost over 1,00 and 1,600 students respectively.

Table 10. Historical PPS Enrollment by Area of Residence*

	PPS Students Residing In HSCL						1998-2003 Change		1998-2003 Average Annual Change	
HSCL	**1998**	**1999**	**2000**	**2001**	**2002**	**2003**	**Number**	**Percent**	**Number**	**Percent**
Cleveland	4,751	4,545	4,600	4,441	4,364	4,185	-566	-11.9%	-113	-2.5%
Franklin	5,987	5,729	5,611	5,567	5,448	5,158	-829	-13.8%	-166	-3.0%
Grant	5,755	5,448	5,186	5,000	4,845	4,587	-1,168	-20.3%	-234	-4.5%

District	50,799	49,361	49,568	49,184	48,097	45,469	-5,330	-10.5%	-1,066	-2.2%

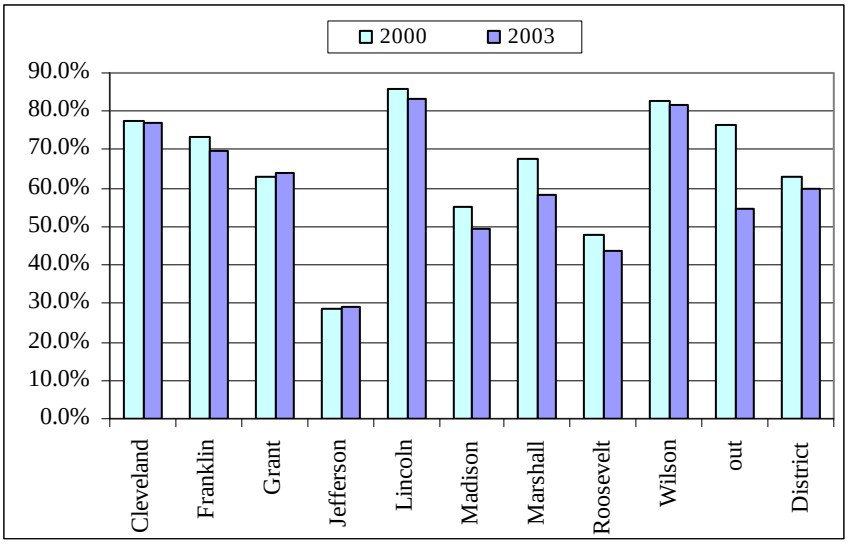

*This table does not include ungraded students nor students residing outside of the district.

Race/Ethnicity of Students Residing in High School Clusters

In the District, enrollment of White students has been decreasing over the last several years. They decreased representation from 63 percent to 60 percent between 2000 and 2003. The same pattern holds true for all HSCLs except Grant, where the White share of students residing increased slightly, and Jefferson, where the share has remained stable. The HSCLs that have seen the greatest change are Marshall and Madison. White students residing in these HSCLs decreased by 10 percentage points in Marshall and 5 points in Madison from 2000 to 2003.

Lincoln and Wilson HSCLs capture the largest shares of white student residents, and Jefferson and Roosevelt the smallest.

Figure 2. White Student Enrollment in PPS

From at least 2000, Black PPS students residing in Jefferson, Cleveland, and Grant HSCLs have decreased, and they have increased in Madison and Marshall HSCLs. The number of black PPS students residing in Franklin, Roosevelt, Lincoln, and Wilson HSCLs has remained stable.

Most HSCLs have seen an increase in the number Hispanic students residing there. Hispanic PPS students are growing at a faster pace than Asians, however. Marshall and Roosevelt are experiencing the greatest increases in their Hispanic PPS student population. The remaining HSCLs have seen an increase except Cleveland where they are fluctuating, and Grant and Lincoln where they are stable.

Asian students residing in PPS are increasing in Franklin and Marshall HSCLs while they are decreasing slightly in Roosevelt and Lincoln HSCLs. The Asian PPS student population has been fluctuating in Madison, and has remained stable in Grant, Cleveland, Jefferson, and Wilson HSCLs.

Based on 2003 enrollments, most minority PPS students reside in Jefferson, Madison, Roosevelt, and Marshall. Forty-six percent of PPS students residing outside of the district are minority students, most of which are Black or Asian.

Blacks represent the greatest proportion of all minority students enrolled in PPS (16%), followed by Hispanics (11%). Most black students reside in Jefferson and Grant HSCLs. The largest share of the District's Hispanic students reside in Roosevelt, Marshall, and Madison HSCLs. Marshall, Madison, and Franklin are the HSCLs where most Asian PPS students reside.

Table 11. PPS Enrollment by High School Cluster Students Reside in and Race/Ethnicity, 2003

HSCL	White	Black	Asian	Native American	Hispanic	Other Race
Cleveland	76.7%	5.7%	8.5%	2.4%	5.9%	0.8%
Franklin	69.7%	5.9%	13.7%	1.9%	8.4%	0.3%
Grant	64.2%	24.7%	4.6%	1.2%	5.1%	0.2%
Jefferson	29.3%	48.0%	6.6%	2.6%	13.3%	0.2%
Lincoln	83.3%	2.8%	8.1%	1.3%	4.1%	0.3%
Madison	49.5%	17.3%	14.7%	2.2%	16.1%	0.3%
Marshall	58.5%	6.7%	15.0%	2.8%	16.7%	0.3%
Roosevelt	43.8%	20.7%	9.4%	3.2%	22.8%	0.1%
Wilson	81.7%	4.3%	6.4%	1.3%	5.9%	0.4%
out	54.4%	20.2%	15.6%	1.5%	7.4%	0.9%
District	59.9%	16.2%	10.0%	2.1%	11.4%	0.3%

Forecasted PPS Students Residing in HSCLs

PPS students residing in Lincoln, Roosevelt, Marshall HSCLs are forecasted to increase slightly from 2003 to 2015. The remaining HSCLs are expected to undergo decreases. The HSCLs that are expected to experience decreases will see more pronounced changes in the next few years than toward the end of the period. Students residing in Roosevelt HSCL are anticipated to initially decrease and then rebound after a few years.

The HSCLs that are predicted to experience the steepest declines are Jefferson, Franklin, and Cleveland. Eight hundred eighty-six fewer PPS students are expected to be residing in Jefferson HSCL by 2015, and 727 and 585 fewer in Franklin and Cleveland HSCLs.

Table 12. PPS Enrollment by Area of Residence*

	PPS Students Residing In HSCL				2003-2015 Change		2003-2015 Average Annual Change	
	actual	projected						
HSCL	**2003**	**2005**	**2010**	**2015**	**Number**	**Percent**	**Number**	**Percent**
Cleveland	4,185	4,050	3,628	3,600	-585	-14.0%	-49	-1.3%
Franklin	5,158	4,923	4,494	4,431	-727	-14.1%	-61	-1.3%
Grant	4,587	4,333	4,052	4,322	-265	-5.8%	-22	-0.5%

*This table does not include ungraded students nor students residing outside of the District.

METHODS AND DATA USED FOR ENROLLMENT FORECASTS

Two types of forecasting models were utilized to prepare the district-wide and attendance area forecasts: 1) the cohort-component model, and 2) the grade progression model. The cohort-component model best predicts student population over the 12-year forecast period. The grade progression model is better suited to account for annual fluctuations in enrollment over the forecasting period.

District-wide Forecast

To develop the district wide forecast, forecasts were first prepared for students residing in each of the district's nine high school clusters using grade progression models (see the description of the grade progression model in the section named 'Individual School Forecasting'). The students projected in each HSCL were summarized to make an initial estimate of the total projected students in the district.

A cohort-component model was then employed to finalize the forecast of district-wide enrollments (see description below). The sum of the forecasted students residing in the HSCLs obtained from the grade progression models, and the preliminary forecast results (see the previously prepared report "Preliminary Forecast for PPS) were utilized as guides to make adjustments to the cohort model to account for recent district-wide demographic trends.

Cohort-Component Model as Utilized for District-wide Enrollment Forecasting

The demographic projection model called the Cohort-Component Model was used to forecast school-age children residing and enrolled in PPS. It models future populations and school enrollments as outcomes of the life events that occur in populations over time. These events are comprised of **births, deaths**, and relocations (**migrations**) into or out of the area. Thus, the District population grows when births outnumber deaths and more people move into the District than leave it. These events occur more often in certain age groups, or **cohorts**, than in others. For example, people tend to move around the most when they are in their 20s and the elderly have lower chances than people in their 40s to

survive over the next 5 years. Applying appropriate age- and gender-specific rates of birth, death and migration to the existing population cohorts of the District would produce its future population including school-age children. Most of these children would attend the area's public schools, however, some of them would not be "captured" by the system: some might attend private schools, be home-schooled, or attend schools outside of the local school district. To address this phenomenon, **capture rates** have to be applied to derive figures of future public school enrollment.

The cohort-component method of forecasting enrollment depends on the availability of accurate data on age and sex composition of the District's population. The most precise information about population age structure in an area is usually provided by the most recent U.S. Census of Population. The cohort-component model is also sensitive to the rates of life events that are applied to the known population cohorts. These rates are usually derived from known data such as those provided by the U.S. Census, and then modified to account for the most recent trends as well as for future ones. Examples of such trends that may affect the future population of an area include the recent tendency among women of childbearing ages to delay having their first child, or a predisposition of young men (ages 20 to 24) to be more mobile than women in the same age cohort. After a decision is made about the plausibility of these trends to evolve in the study area, a set of assumptions is developed to address likely changes in the initial rates of life events. Since the existing population structure defines future population composition of the area, the method works best in the short and medium range.

The population and housing data came from the 1990 and 2000 Censuses of Population and Housing; additional housing information and building permit data were obtained from the Metro Data Resource Center and the Portland Planning Department; the Oregon Health Division provided information on fertility and mortality; the Department of Education and the Portland Public Schools furnished past and current enrollment data and information about home schooling; and PRC conducted a survey of local private schools.

The 1990 and 2000 population of PPS was derived from the 1990 and 2000 Census at the census-block level by age group and sex. The census blocks were allocated into the District's boundaries using Geographic Information Systems (GIS); the allocation was required since the census blocks did not match the District's boundaries. The 1990 population data were then organized into five-year age cohorts, such as 0 to 4 years, 5 to 9 years, and so on. Each of these cohorts was then "survived", or aged into the next cohort by the year 1995. "Surviving" the cohorts is accomplished by applying age- and sex-specific survival rates. These rates represent the proportion of population in each younger cohort that would survive during a given time period (such as the 5 years between 1990 and 1995) to become the next older cohort. This process is repeated for each five-year age and time interval between 1990 and 2015. Forecasting a known population and its age distribution enables appropriate adjustments to be made to the model so that the forecasted population becomes aligned with the actual population and ensures the accuracy of the model's projections.

During each five-year interval, a certain number of live births occur to the women in childbearing ages. To calculate the number of newly born residents of the District, age-specific fertility rates were applied to the numbers of women in childbearing cohorts (10-14, 15 to 19, 20 to 24, and so on up to 45 years and over). Fertility rates indicate how many children women in a given age group are likely to produce during each five-year period. Once developed, the data on new children become subject to survival rates and is "moved", or "aged", through the system like all the other cohorts.

The most difficult part is to estimate the in- and out-migration of an area. In reality, since little reliable data are available to study in- and out-migration, one works with net migration rates, or the balance between in- and out-migration. Net migration can be calculated if the population is known at the beginning and the end of a time period, as well as the number of births and deaths. Net migration is positive when more people move into the area than leave it; it is negative if the opposite is true. Net migration rates used in the cohort-component model can be interpreted as the number of people who are added to (or

subtracted from) a given cohort per each 100 persons due to migration over a given period of time (in this case, five years). The initial net migration rates for the cohort-component model were derived from the 1990 and 2000 population cohorts for the census tracts that are located within the school district boundaries as well as births and deaths that occurred in the same area during 1990-2000. The rates were adjusted so that the forecasted population for the year 2000 fit the actual population obtained from the 2000 Census. The net migration rates used to forecast the District's population in 2002-2010 were further modified to reflect the most likely future migration patterns; these migration patterns are greatly influenced by housing growth in the area, both current and forecasted. When making the final adjustments to the net migration rates, consideration was given to what local planners predict will happen in the area. This study assumes that migration is and will remain the major force behind the rates of population and enrollment growth in the District.

The longer the time span of the forecast, the more variables come into play, increasing the uncertainty in rates and assumptions. Thus, it is crucial to have recent data that would allow testing, or calibrating, the assumptions used in the model. The District's historical enrollment helped to calibrate and adjust original migration rates so that a better fit between actual and predicted enrollment figures could be achieved.

Individual School Enrollment Forecasts

Long-term forecasting of PPS school enrollments required 2 main stages: 1) forecasting of students residing in sub-areas within the District (high school clusters and elementary school attendance areas), and 2) allocating the forecasted students to schools of attendance.

Forecasting District Sub-areas with the Grade Progression Model

To prepare the small area forecasts of students a grade progression model was created for each high school cluster (HSCL) and elementary school attendance area (ESAA). The grade progression models are comprised of recent grade progression ratios (GPR) for PPS

students residing in each attendance area by grade level. The GPR is the proportion of students enrolled in one grade level divided by the number of students enrolled in the preceding grade level in the previous year. One ratio is associated with each grade level for students entering grades 1 through 12. Recent local trends are captured in the construction of the GPR model. The model accounts for the effects of migration, changes in population, housing growth due to new construction, dropout rates, and the percentage of students residing within the attendance area that are attending private schools or being home-schooled.

In order to determine the GPRs for the future, weighted averages of the ratios for each grade level from the past four years were calculated. A heavier weight is applied to the years that are assumed to have more bearing on future enrollments, allowing the trends of those to dominate over the other years.

The 2003 enrollments were multiplied by the GPR weighted averages to obtain the forecasted 2004 enrollments. The same GPRs were then applied to the 2004 enrollments to calculate the forecasted 2005 enrollments and so on until the 2015 enrollments were calculated. To account for predicted changes in the demographic factors that influence school enrollments, adjustments were made to the weighted average GPRs on an individual year basis for each grade level by applying a multiplier to accelerate or hinder growth. The factors that were considered for every attendance area are the annual number of births, residential building activity, racial/ethnic composition of student population, and enrollment trends. The adjustments were based on findings from the analysis of data on student enrollment and geocoded student addresses, birth and building permit records.*

Kindergarten Forecasts for Attendance Areas

The numbers of students entering kindergarten from 2004 to 2015 were forecasted from another method. To predict the number of kindergartners that will attend PPS, a "kindergarten capture rate", the ratio of the actual number of PPS kindergarten students in

an attendance area to the number of births in the same attendance area five years earlier, was calculated for four separate years. A weighted average of the "kindergarten capture rates" for each attendance area was multiplied by the number of births in the corresponding area to forecast the number of kindergartners that will attend PPS schools in 2004 to 2015. Birth data are only available up to 2002, therefore, to predict PPS kindergartners after 2007, the number of annual births during 2003 through 2010 had to be predicted. The births were projected based on four-year historical trends from 1998 to 2002. After the births were predicted, the kindergarten capture rate was applied to forecast the number of kindergartners 5 years later.

Ungraded Students and Students Residing Outside the District

The ungraded students (UN) were forecasted by taking a 4-year average of the proportion they represent of the total enrollment. The same proportion was applied to the forecasted enrollments for each year 2004 to 2015 to obtain the total UN students forecasted to be enrolled in PPS.

The students residing outside the district were projected by extrapolation of numbers based on recent 4-year trends.

Reconciliation of Small-area Forecasts to the District-wide Forecast

The District-wide forecast under the most-likely scenario served as the control to which the sum of the attendance area forecasts would reconcile. The forecasts for the high school clusters were adjusted to sum consistently by grade level to the district-wide forecast. The forecasts for the ESAAs were adjusted to sum to those for the high school cluster in which they were located. In the end, the sum of the ESAA forecasts add up to the sum of the HSCL forecasts and the sum of the HSCL forecasts add up to the District-wide forecast.

* Data sources: Historical and current student data, Portland Public Schools; Birth data, Oregon Department of Human Services, Health Division; Building permit data, Metro.

Allocating the Forecasted Students Residing in ESAAs to Individual Schools

After the forecasts of students residing in the ESAAs were reconciled to the district-wide forecast, the students were then allocated to the school they were predicted to attend. The students were assigned to their attending school based on probabilities derived from recent enrollment data. Cross-tabulations were made of students by the ESAA they reside in and by the school they attend. A cross-tabulation was created for each grade level, K-2, 3-5, 6-8, and 9-12. The probabilities for how many students residing in each ESAA to attend which schools were calculated and the students were allocated to the appropriate schools each year in the forecast period. Probabilities were also calculated for the total number of ungraded (UN) students to attend PPS schools and allocated to particular schools in the same manner as the other students. Forecasts for individual elementary, middle, and high schools were prepared for the four grade levels and for the UN students.

Please note: The original calculations for the enrollment forecasts use decimal fractions. Because the fractions are rounded to show whole numbers, the numbers may not add exactly to the totals.

All population and enrollment forecasts are based on a combination of a beginning population, various rates, and the forecasters' judgment about future trends. They may err through imperfect data or unexpected shifts in demographic trends. Generally forecasts for larger geographical areas, such as the entire school district, are more reliable than those for small areas, such as for an individual elementary school. The forecasts for the individual schools are based mainly on births and enrollment trends in the ESAAs over the past 4 years. Although they are adjusted to conform to the longer- term forecasts for the high school clusters and the district as a whole, this does not take into account local variations that may have a significant effect on an individual school's enrollment. These forecasts may be used as a guide to enrollments for individual schools over the next few years. But changes in local areas will surely affect enrollments in some areas and actual enrollments will deviate from those shown here. Given the large number of schools and the complexity

of changing urban neighborhoods, some differences between the forecasted and actual enrollments will vary in magnitude and perhaps direction.

The enrollment figures do not include students enrolled in the Columbia Regional programs.

APPENDIX 3

Data Sources

This report is based on data obtained from several sources, including:

- Decennial Census. The decennial census is the only source of data collected for small areas across the nation. We used 1990 and 2000 census data to calculate the population, by age and sex, residing in the Portland Public School area. We compared the changes from 1990 to 2000 to develop an estimate of the age-sex profile for net migrants.

- American Community Survey. This is a new U.S. Census Bureau survey that is being tested in Multnomah County and several other sites in the United States. It was begun in 1996, with a large survey of households in Multnomah County, followed by smaller surveys in 1997 and following years. The American Community Survey asks the same questions as the 1990 census. We used the 1990 and 2000 Censuses and 1996 American Community Survey data to develop estimates of household and population change, including estimates of net migration for the Portland Public School area.

- Portland Public School Enrollment Data. Portland Public School staff furnished information on enrollments for recent decades, including enrollments by grade for the past decade. We also obtained data files on all students in 1993, 1996, and 1999 to 2003 with their residential addresses. These data are valuable for examining the in and out-flows of students in elementary school attendance areas. We did not request nor obtain any student data with personal information.

- PPS student record data from 1998 to 2003 have been analyzed by PRC to track student movement into and out of the District on an annual basis. The data include the students' race and ethnicity in addition to the location of student residences. The student records were linked to a housing database so that characteristics of the dwellings that house families with students, such as tenure (owned or rented housing), structure type (multi-family or single-family), age of housing, and housing value, could be ascertained. Students moving in and out of the District and some of the demographic characteristics of these movers could be monitored from one year to the next by following the student identification number. From the student enrollment data it can detected how migration patterns for individual racial and ethnic groups and for students in rental and owner occupied housing affect overall migration patterns.

- Building Permit Data. Information about building permits issued for construction of residential housing was obtained from Metro's Regional Land Information System, 2003.

- Birth and Death Data. Information on births and deaths reported for the Portland Public School area were obtained from the Oregon Health Division. The data were used for two purposes. One use was for calculating overall fertility and mortality rates for the School District. These rates were used in the demographic model. The second use was to note the residence of the births in order to examine the correspondence between births and enrollment changes.

- Private School Data. We rely on two sources of information on private schooling for this report. One source is from the Oregon Department of Education. These data originate from reports at the local level about the number of students who attend private schools. A second source was obtained through a survey that we conducted in December 2003. We phoned all known private schools in the Portland area, requesting information about their enrollments and the places of residence for their students. We

compared this information to the reports obtained by the Oregon Department of Education.

- Home School Data. Information on the number of students in home schooling was obtained from the Multnomah Educational Service Department.

Enrollment Forecast
2004-2015
and
Revised Forecast Tables

Prepared by:
Population Research Center
Portland State University

August 2004

This document contains revised forecasts for enrollment by school based on detailed analysis of housing growth in Forest Park ES attendance area (Lincoln HS attendance area), and of the likely impacts of the closing of Columbia Villa (Roosevelt HS attendance area) and the reconstruction of New Columbia. Use the tables in this report to obtain enrollment forecasts by school. Use "Portland Public Schools Enrollment Forecast, 2004-2015", March 2004 for the general explanation of how the forecasts were made and the assumptions on which they were based.

Introduction

This document is an addendum and is meant to read in conjunction with the Portland Public Schools 2004-2015 PPS Enrollment Forecast Report prepared by the Population Research Center in March 2004. Since the preparation of the Forecast Report, an in-depth study of two areas experiencing dramatic demographic change within the District of Portland Public Schools (PPS) has been made. The enrollment forecasts were revised after special consideration was given to planned and measurable housing growth in the two different areas in the District. This document contains a revised district-wide enrollment forecast under the medium growth scenario, and revised enrollment forecasts for individual schools by grade level.

The two study areas that the enrollment forecast revision is founded on are:

1) Forest Park elementary school attendance area (ESAA) in Lincoln high school cluster (HSCL) - an area where mostly single-family owner-occupied upscale housing is being constructed; and
2) New Columbia Housing Community development located across parts of Clarendon and Ball ESAAs in Roosevelt HSCL. The housing units in the new development will be affordable units and will consist mostly of rental units with some owner-occupied units.

The nature of the studies and the impact of population and housing growth on PPS enrollments are different for the two study areas. In Forest Park study, the population and housing growth under consideration are defined by the boundary of the entire ESAA. The occupants of the new housing are expected to come from outside the district, adding to district-wide enrollment. The housing growth in Forest Park is anticipated to have little impact on PPS enrollments in other areas of the District.

The new housing development of the New Columbia study is located across, but not entirely covering, two ESAAs - Ball and Clarendon. Students from many areas within the district are anticipated to inhabit the new housing development and the majority of new residents are anticipated to move from within the district. The construction of the new housing development will influence enrollments outside of Ball and Clarendon.

The organization of this report is as follows:

1) Summaries of Forest Park ESAA and New Columbia studies and revisions (housing and students added, assumptions used, and outcomes)
2) More detailed description of the methodology used for each study, and of the influences of housing growth of each study area on PPS enrollments
3) Revised enrollment forecast tables
4) Appendix with revised supplementary tables in original report.

Summary of Forest Park ESAA Study and Revision

Housing Units Added and PPS Students Generated:

	2004	2005	2006	2007	2008	2009	Total
Housing Units Added	56	56	16	15	15	15	174
New PPS Students in Forest Park ESAA	21	23	7	6	6	6	**69**
K-2	9	9	3	2	2	2	28
3-5	6	6	2	2	2	2	19
6-8	3	4	1	1	1	1	11
9-12	3	4	1	1	1	1	11

Assumptions Used in Forecast Revision:

1. The only influences of enrollment change in Forest Park ESAA are new housing construction and current and future births in the area.
2. Births will slightly decrease during the forecast period.
3. The students already residing in Forest Park ESAA will age-in-place without anyone moving out.
4. There are 0.40 PPS students per housing unit.
5. Future housing units added beyond 2009 are estimated to be 50-70 single-family units.
6. New PPS students will be moving to Forest Park ESAA from outside of the district.
7. The existing age distribution of PPS students residing in Forest Park ESAA is assumed for the in-movers: 70% grades K-5; 15% grades 6-8; 16% grades 9-12.
8. The number of ungraded (UN) students remains the same as in March 2004 forecast.

Areas Impacted by Housing Growth:

The areas impacted by new housing construction within the Forest Park ESAA is limited to the Forest Park ESAA itself and Lincoln HSCL, with a minimal impact to the District as a whole. The amount of growth in Forest Park ESAA is the amount of growth district-wide.

The findings of the Forest Park study show that the housing growth rates in the area are lower than those assumed in the previous forecast. As a result, fewer students are

expected to move to Forest Park ESAA than previously predicted. However, the change represents only about a -8.5 percent difference in the overall number of PPS students residing in Forest Park ESAA during the forecast period in the revised residing forecast.

Fewer students in elementary school are anticipated to be residing in Forest Park ESAA during the forecast period than previously expected. However, Forest Park ESAA is predicted to be home to a greater number of middle and high school students.

Enrollments Impacted by Forecast Revision:

Enrollments at the elementary grade levels are forecasted to be lower in the revised forecast than in the previous forecast. Forest Park Elementary School is predicted to have 76 fewer students in 2007 than in the original forecast. This represents a -16.2 percent change.

Enrollment in the middle and high school levels are slightly higher in the revised forecast than in the original forecast. About 32 more middle school students are anticipated to be attending West Sylvan in 2007 than previously forecasted, and enrollment in Lincoln High School is 24 students higher.

Summary of New Columbia Study and Revision

Housing Units Added and PPS Students Generated:

	2005	2006	2007	total
Housing Units Added	254	352	178	784
PPS Students Moving to New Columbia	315	405	183	903
K-2	75	107	48	230
3-5	70	121	55	247
6-8	72	85	38	195
9-12	99	91	41	231

Assumptions Used in Forecast Revision:

1. The site of New Columbia has the same footprint as Columbia Villa; the same proportions of New Columbia's PPS students will reside in Ball and Clarendon ESAAs as they did in Columbia Villa (most will live in Clarendon area of New Columbia).
2. When the first phase of construction is complete in 2005, the first occupants of the available units in New Columbia will be the former residents of Columbia Villa that have been relocated during the construction period.
3. About 70 percent of relocated Columbia Villa residents will return to New Columbia. It is known where currently reside (some are from outside district 10%).
4. New occupants of the remaining new units in New Columbia in 2006 and in 2007 will be drawn from within the school district based on 2000-2002 trends of where new Columbia Villa residents came from and on. (Trends: depends on the median household income and distance from the Columbia site). The number of children and the number of very low-income households residing in the ESAAs that were the source of most Columbia Villa student movers were also considered.
5. Most new residents will be coming from ESAAs in the Roosevelt and Jefferson High School Clusters.
6. There will be an average of 1.15 PPS students per housing unit in New Columbia
7. The age distribution of the PPS students moving to New Columbia in 2006 and 2007 is similar to the age distribution for the local area reported in the 2000 Census.
8. Students are assigned to grade levels K-2, 3-5, 6-8, and 9-12, none to UN. The number of ungraded (UN) students remains the same as in March 2004 forecast.
9. The impacted students will progress or move through grade levels over time and will be captured as the rest of enrollments were originally forecasted based on

historical enrollment trends of where students reside and which schools they attend.

Areas Impacted by Housing Growth:

The areas most impacted by the development of the New Columbia Housing Community are mostly ESAAs within the Roosevelt and Jefferson HSCLs; to some extent, ESAAs in Madison and Marshall HSCLs are affected, and to a lesser extent, various other ESAAs within the District are impacted.

The number of PPS students residing in all of the impacted areas except Clarendon and Ball ESAAs will experience a decrease. The number of PPS students residing in Clarendon and Ball ESAAs combined will increase beginning in 2005 and will double by 2007 due to the opening of New Columbia.

Enrollments Impacted by Forecast Revision:

The most heavily impacted schools are in Roosevelt HSCL followed by those in Jefferson HSCL. Aside from Clarendon, of the most impacted schools, Ball and Astor are the only elementary schools where total enrollment is predicted to be higher than in the previous forecast.

Clarendon Elementary School's enrollment is predicted to be 290 higher in 2007 in the revised forecast than in the original. This represents a change in the forecast by about 85 percent. Ball's enrollments are also higher after the revision, but only by 40 students, or approximately 18 percent.

Portsmouth Middle School in Roosevelt HSCL and Roosevelt High School are the only middle and secondary schools with higher enrollments due to the development of New Columbia housing. The increase in the predicted enrollments in these schools is 25 percent and 11percent, respectively.

Forest Park ESAA

Housing Growth

The potential for new residential development and the number of new housing units planned for new construction in the Forest Park ESAA were obtained from a study conducted by Sumner Sharp and Shelly Holly, planning consultants to PPS. Their findings show that 335 new housing units will be built in the Forest Part ESAA and that all will have become available for occupancy by 2009 (see their report entitled "Forest Park Boundary Study, April 2004 for detailed information). The schedule for completion of the planned new housing units by the type of unit is shown in the table below.

Table 1. Number of New Housing Units Added by Time Period

	2004 and 2005	2007, 2008, and 2009	Total
Single Family Units	111	63	174
Multi-family Units	161	0	161
Total	272	63	335

There are over 200 vacant residential tax lots in Forest Park ESAA that are not planned for development at this time. However, taking building constraints into account, such as land conservation and preservation zones, steep slope, and the lack of infrastructural services, **only about 50-80 vacant tax lots remain ready for development sometime in the future.**

Estimated New PPS Students Moving to Forest Park ESAA and Timing of Move

The 161 new multi-family units will consist of one and two bedroom units. It is estimated that **the number of children that will live in the apartments and attend PPS schools is too minimal to have an effect on enrollments**. This estimation is based on the numbers of children in existing multi-family housing units the same size.

The number of PPS students moving to Forest Park ESAA was estimated utilizing the number of single-family housing units that are currently being constructed or that are planned for development. Most of the new units will be added by 2005. Fewer new units are scheduled for completion during 2006 to 2009. It is approximated that during 2004-2005, 55 or 56 units will be completed each year, and during 2006-2009, only about 15 or 16 will be ready for occupancy.

Table 2. Number of Single-family Housing Units Added per year by Time Period

	2004 and 2005	2007, 2008, and 2009
Yearly Available (approximate)	56	15-16

Based on 2003 PPS enrollment data and tax lot information, it is estimated that in Forest Park ESAA there is an average of 0.40 PPS students per single-family housing unit. Multiplying this figure by the number of new housing units planned for construction yields a total of **69 new PPS students that will be residing in Forest Park ESAA by 2009.**

Table 3. Estimated Number of PPS Students Added by Time Period

Average Number of PPS Students per Housing Unit	2004-2005	2006-2009	Total
.40			
New Students	44	25	69

PPS student data from 2003 reveal that most PPS students residing in Forest Park ESAA are currently of elementary school age and that the percentage of all the PPS students residing there attending middle and high schools are about the same (see table below).

Table 4. Percentage of PPS Students Residing in Forest Park by Grade Level

Grade Level	% of PPS Students
K-2	42%
3-5	28%
6-8	15%
9-12	16%

Utilizing the same age distribution of PPS students in Forest Park ESAA, the number of the new PPS students predicted to move into Forest Park ESAA's new housing units is estimated by age.

Table 5. Estimated Number of PPS Students Added by Time Period and Grade Level

	2004-2005		2006-2009	
Grade Level	**Total New Students Added**	**Added Each Year**	**Total New Students Added**	**Added Each Year**
K-2	18	9	10	2-3
3-5	12	6	7	1-2
6-8	7	3-4	4	1
9-12	7	3-4	4	1

At least 95 percent of all PPS students that reside in Forest Park ESAA attend their neighborhood school. Of those in elementary school that do not, almost all attend other schools in Lincoln high school attendance area.

Where the Students will be Moving from

It is assumed that new residents will either move from within the District or from outside of the District. However, even if all moved from areas throughout the District, because the number of students estimated to be moving to Forest Park ESAA is relatively small, the impact would be minimal on school enrollments in any one area outside of Forest Park and Lincoln attendance areas.

Method to Adjust Enrollment Forecast

Changes were initially made to the forecast of where PPS students live, called the 'residing forecast for ESAAs'. The number of students residing in Forest Park ESAA in 2003 and their distribution by grade level were entered into a Grade Progression Model (GPR model). The grade progression ratios (GPRs) were initially set to values of 1.00 so that all of the students would age in-place.

The Model was then adjusted to increase the numbers of students in 2003 that progressed to the next grade level in 2004 by the number of students predicted to move to Forest Park by fall of 2004. The sum of the students for 2004 was then progressed to 2005, and the new students expected to arrive in 2005 were added in the same manner. The process was repeated adding new students each year through 2009.

The grade progression ratios in the GPR model for years 2010-2015 were adjusted up slightly to account for some new housing growth that may occur if the remaining 50-70 vacant lots were developed.

After the Forest Park ESAA residing forecast was revised and the district-wide forecast was reconciled, the students were then allocated to the schools they were predicted to attend as described in the March 2004 forecast report.

Impact of Housing Growth in Forest Park ESAA and Revised Forecast

A large influx of young school-age children to the Forest Park ESAA during the forecast period is not expected to occur. The high population and housing growth rates experienced in Forest Park during recent years are declining as the area approaches a "built-out" situation. It is estimated that approximately 95 percent of the area zoned for residential construction has already been developed. The new construction that has translated into new PPS students in previous is slowing down and the children currently residing in Forest Park are aging in place.

In addition, the fertility rate for Lincoln high school attendance area is the lowest of all high school attendance areas in PPS and the fertility rate for Forest Park ESAA is assumed to be amongst the lowest in the District. There has been no significant increase of ethnic minority population groups that would influence birth rates in the future. Although the number of births in Forest Park ESAA had been increasing annually during from 1993 to 2001 (due to in-migration), they decreased in 2002. It is predicted that the number of births in Forest Park ESAA will continue to decrease slightly.

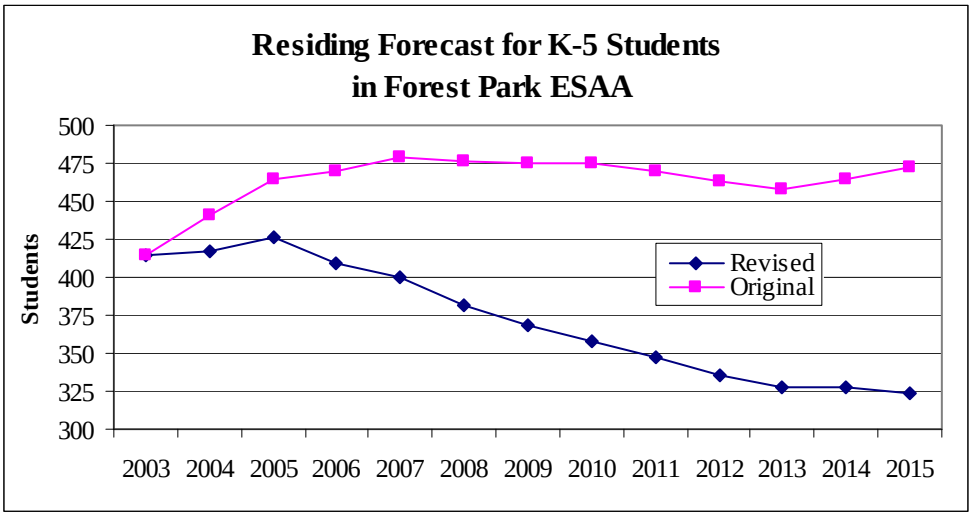

Areas outside of Forest Park ESAA were not impacted by the revision of the residing and enrollment forecasts, but there was a slight impact on the District-wide enrollment forecast. The change in the number of PPS students in Forest Park ESAA is also reflected in the District total.

Population growth in Forest Park is not as great as previously predicted. However, **the overall difference is relatively minimal.** Only 114 fewer students are now predicted to be residing in Forest Park in 2015 than in the previous forecast, but the growth pattern remains about the same.

There is a more pronounced change on the distribution of growth predicted by the different grade levels. The impact of the revision of the residing forecast is about the same as the impact on the enrollment forecasts for Forest Park Elementary, West Sylvan Middle, and Lincoln High schools.

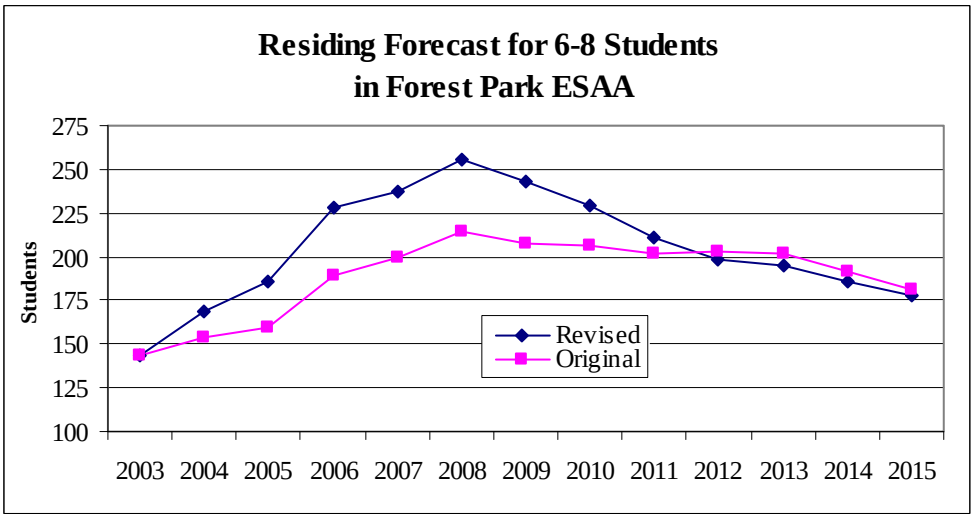

The greatest impact of the forecast revision on students residing in Forest Park ESAA is on those in grades K-5. One hundred forty-three fewer K-5 students will be residing in Forest Park ESAA in 2015 and 149 fewer will be attending Forest Park Elementary School than originally forecasted (see Figure 1).

Figure 1.

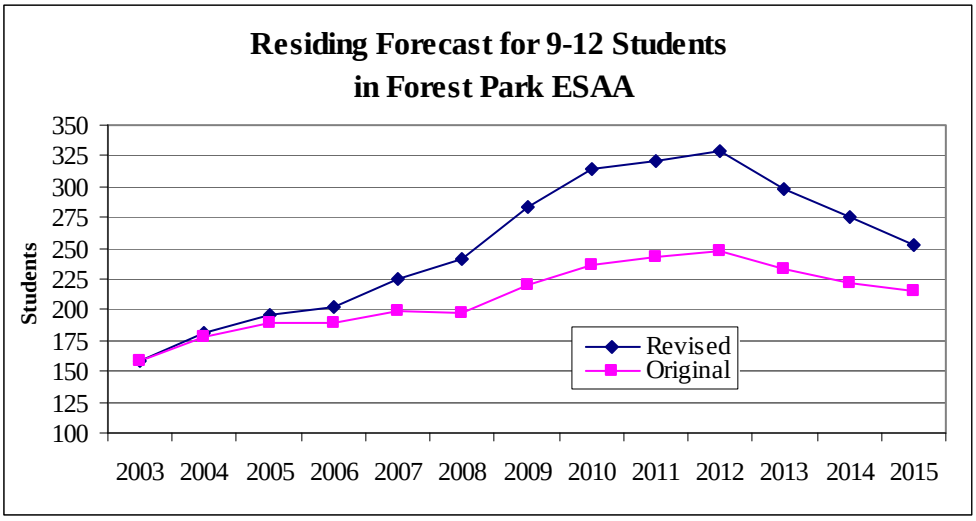

Grades 6-8 will see 15 to 40 more students residing in Forest Park ESSA than in the previous forecast during 2004-2011. By 2012, the number of middle school students expected to be residing in Forest Park ESAA is almost the same in both forecasts (see Figure 2.).

Figure 2.

The number of high school students forecasted to reside in Forest Park throughout whole period is slightly more than previously forecasted. The difference varies between 3 and 80 students in a given year. The greatest difference between forecasts is seen during 2009 – 2013 (see Figure 3).

Figure 3.

New Columbia Housing Community

Housing Growth

The construction of 784 housing units is planned for the New Columbia Housing Community. The majority of these housing units are designed to be family-friendly with enough bedrooms to accommodate families with children. The Housing Authority of Portland, the sponsor of the project has guidelines of who will be able to inhabit the units according to family size.

The number of housing units that will be completed and become available in time for fall school enrollments are displayed in the table below. The first housing units will become available in 2005 with construction ending in 2007.

Table 6. Number of and Time Schedule of New Housing Units Added

New Housing Units (owner and renter-occupied combined)			
Fall 2005	**Fall 2006**	**Fall 2007**	**Total New Units**
254	352	178	784

Children Estimated to Reside in New Columbia

The number of children that the new units will be home to was estimated by the Housing Authority of Portland (HAP) utilizing the average number of children per housing unit by the size of housing units (number of bedrooms) in the immediate geographic area of the old Columbia Villa community and other comparable HAP properties.

The number of these children that are of school age and their age distribution by grade level was calculated assuming the single-year age distribution of the 0-17 population reported by the 2000 Census for the census blocks that the HAP properties are located in .

To estimate the number of school-aged residents that will attend PPS, the historical capture rate, or the percentage of all children that resided in the old Columbia Villa that attended PPS, was applied to the estimated number of school-age children predicted to be residing in New Columbia.

Table 7. Statistics Used to Estimate New Columbia's PPS Students

Average number of children per housing unit (for all unit sizes)	Percentage of Children that are School-Aged	Proportion of School-Age Children by Grade Level*				Capture Rate (% of school-age children that attend PPS)	Average number of PPS Students per Housing Unit (for all unit sizes)
		KG-02	03-05	06-08	09-12		
1.71	70%	26%	30%	21%	23%	96%	1.15

*used to estimate new residents moving in 2006 and 2007.

Based on the age distribution of the new residents and the number of new housing units to be constructed, the total number of PPS students that are estimated to be moving into the New Columbia Housing Community by 2007 is 903. Dependent on when the units will become available, 80 percent of the PPS students predicted to be residing in New Columbia will have moved in by fall of 2006.

Table 8. Number and Time Schedule of PPS Students Moving to New Columbia

Time Schedule	PPS Students Moving to New Columbia
Fall 2005	315
Fall 2006	405
Fall 2007	183
Total	903

The new students are assumed to reside in Ball and Clarendon ESAAs based on the historical configuration of the Columbia Villa site and how it was situated in Ball and Clarendon attendance areas. Eighty-six percent of Columbia Villa's PPS students were residing in Clarendon ESAA and 14 percent in Ball ESAA. There is some variation in which ESAA the students resided in by grade level, but no more than 20 percent were living in the Ball ESAA portion of Columbia Villa in any one grade level. The distribution of students in the table below was utilized when allocating the New Columbia students to the ESAA they will be residing in.

Table 9. Distribution of Columbia Villa's PPS Students by Grade Level and ESAA Residing in

	PPS Students that Resided in Columbia Villa	
Grade Level	**Ball ESAA**	**Clarendon ESAA**
K-2	21%	80%
3-5	12%	88%
6-8	14%	86%
9-12	10%	90%
Total	14%	86%

Where New Columbia's PPS Students be Moving from and Timing of Move

As the new housing units become available, they will be occupied by new PPS students. The new residents of New Columbia are generated by two different methods depending on whether they move in 2005 or in 2006-2007.

2005 New Residents

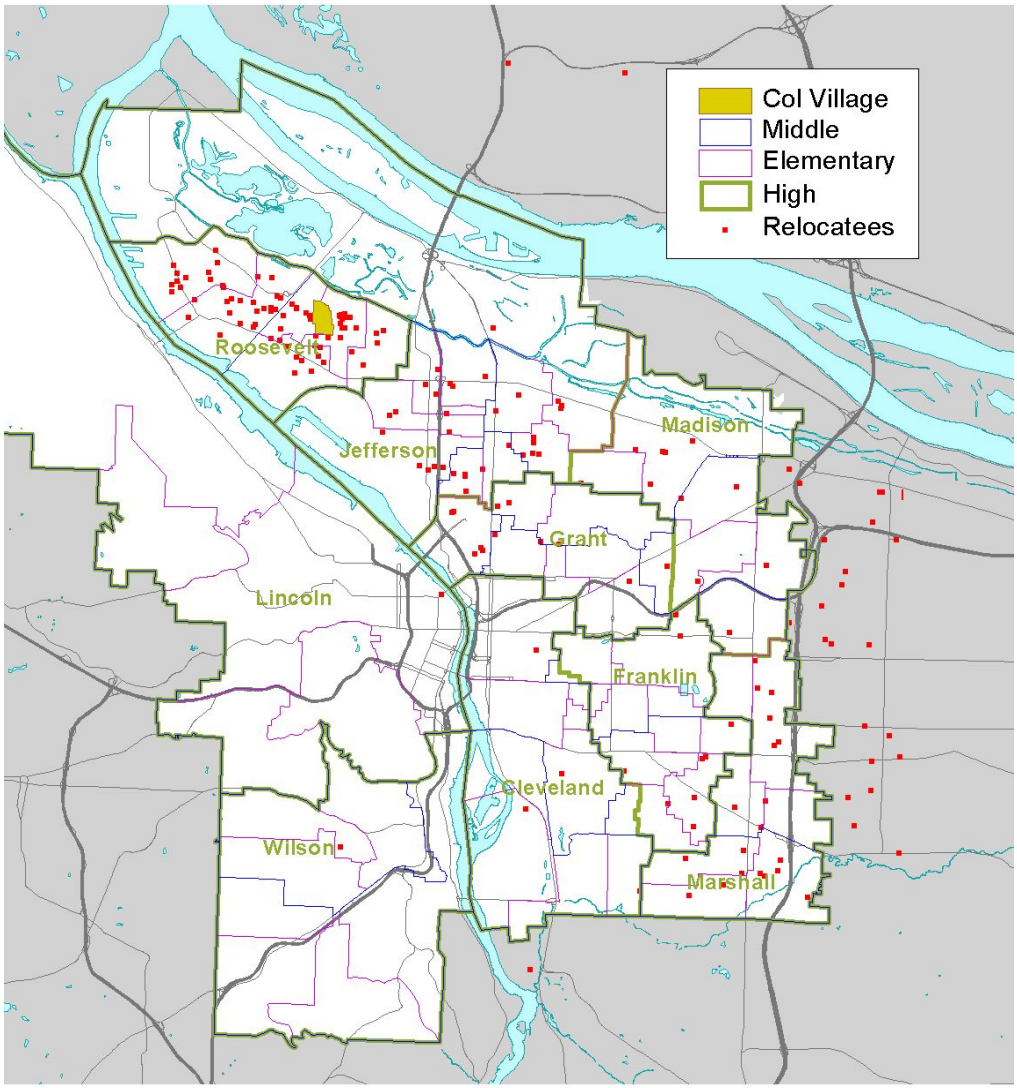

About 483 PPS students were relocated by the Housing Authority of Portland when Columbia Villa closed. It is assumed that 70 percent of the relocated former Columbia Villa residents, or 338 students, will return to the New Columbia housing community. It is also assumed that they will occupy the first available units. The 315 PPS students estimated to inhabit the new housing units in 2005 will be the returning relocated PPS students. The grade level distribution of the returning PPS students in 2005 is reported in Table 10 below.

Table 10. Grade Level Distribution of Relocated PPS Students Moving to New Columbia

	KG-02	**03-05**	**06-08**	**09-12**	**Total**
Grade Level Distribution of New PPS Students	24%	22%	23%	31%	100%
New PPS Students	75	70	72	99	315

In 2005, the previously relocated PPS students will be moving back from 38 different ESAAs in the District (see Figure 4). It is estimated that fifty-eight percent of the new student residents will be coming from ESAAs in Roosevelt, Jefferson, and Marshall high school clusters (HSCL). Twenty-eight percent will be coming from outside of the district. The remaining 14 percent will be coming from ESAAs in other HSCLs in the district, except Lincoln where no Columbia Villa residents were relocated.

Figure 4.

Thirty-two percent of the new 2005 residents will be coming from Roosevelt HSCL. Most will be coming from Sitton, Ball, and James John ESAAs. Thirty-five students, or 11 percent of the students moving to New Columbia Housing Community are already residing in Ball or Clarendon ESAAs.

Table 11. Number of Relocated Students Moving to New Columbia in 2005 from Area Previously Relocated to.

HSCL	Students	% of Total Relocated Students Moving New Columbia
Roosevelt	101	32%
Jefferson	48	13%
Marshall	38	12%
Madison	15	5%
Grant	8	5%
Cleveland	5	2%
Franklin	7	2%
Wilson	3	1%
Lincoln	0	0%
Outside PPS	90	29%
Total	315	100%

2006 and 2007 New Residents

Four-hundred five PPS students are expected to move to New Columbia in 2006 and 183 in 2007. The remaining 23 previously relocated students (338-315) will return in 2006 under the same assumptions as in 2005. Three-hundred eight-two other PPS students are expected to move to New Columbia in 2006 (405-23=382) and 183 in 2007.

The 2000 Census age-distribution of area residents was used to determine the age distribution by grade level of new PPS students moving into New Columbia in 2006 and 2007.

Table 12. Grade Distribution and Number of New PPS Students

	KG-02	03-05	06-08	09-12	Total
% New PPS Students by Grade Level	26%	30%	21%	23%	100%
2006	99	115	80	88	382*
2007	48	55	38	41	183

*Of the 405 PPS students expected to be moving to New Columbia in 2006, 23 are assumed to be previously relocated students that will return.

In an effort to gauge where they will come from, historical migration patterns of movers to the old Columbia Villa were studied. Similar patterns were used to generate the occupants in the New Columbia units that will become available in 2006 and 2007.

Upon examination of where former Columbia Villa residents came from, it is found that PPS students and their families moved to Columbia Villa from other ESAAs within the District, and that **the distance from the Columbia housing development and median household income of the ESAAs are related to the where the movers are coming from.** Most new residents (85%) came from ESAAs within three miles of the new development and where median annual household income was less than $60,000. Some new residents came from ESAAs with similar median income located 4-8 miles from Columbia Villa.

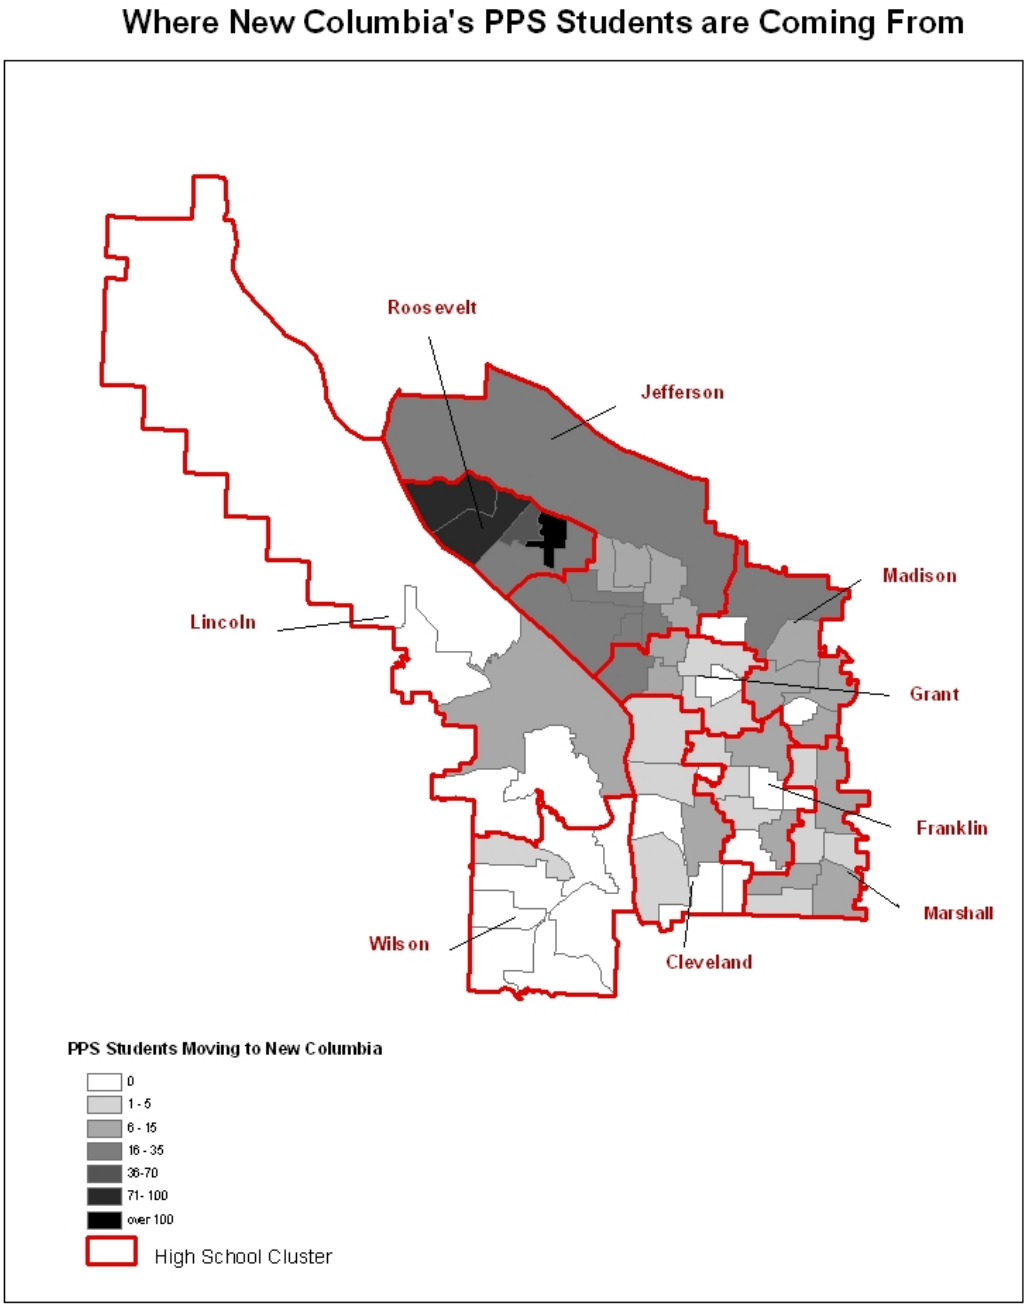

The number of PPS students and their families that moved to Columbia Villa from ESAAs that are over 8 miles away and where median income is greater than $60,000 did not provide a significant enough number of PPS students to have an impact on school enrollments. Each is estimated to have contributed less than one-half of one percent of total new occupants.

The percentage of residents that moved from each ESAA to Columbia Villa was calculated. The percentages were used to help predict where New Columbia PPS students will be coming from and how many will be coming from each area to inhabit New Columbia housing in 2006 and 2007 (see Table 13 and Figure 5).

High School Cluster

Based on the historical migration patterns described above, and taking into consideration the number of low-income children that reside in the ESAAs most affected by the previous move to Columbia Villa, an estimate was prepared of how many New Columbia residents are expected to move from the different ESAAs. The ESAAs that contributed the most student movers to Columbia Villa - Ball, Clarendon, King, Humboldt, James John, Sitton, and Boise-Eliot – are assumed to be the source of most student movers to New Columbia. However, the numbers of students are expected to move from each of these ESAAs are based on the number of children and very low-income households that are residing in each area (as reported in the 2000 Census). See Table 14 below.

Table 14. Where PPS Students are Predicted to be Moving from to Occupy New Columbia

Method to Adjust Enrollment Forecast

Changes were initially made to the previous forecast of where PPS students live, called the 'residing forecast for ESAAs'. After the number of students moving to New Columbia were estimated, the students were subtracted from the ESAA they will be moving from or from outside of the district, and added to Ball and Clarendon ESAAs each year beginning in 2005 and ending in 2007. The student movers were aged and progressed through grade levels over time as they were in the original forecast and population change from other influences were kept intact. However, the impact on the change in the number of students predicted to reside in New Columbia on a year-to-year basis is very minor.

After the residing forecast was revised, the students were then allocated, or assigned, to the schools they were predicted to attend as described in the March 2004 forecast report.

The average percentage of PPS students residing in Ball and Clarendon ESAAs that attend either Ball or Clarendon schools is about 80 percent. Historically, about 80 percent is also the percentage of the K-5 Columbia Villa students that attended the neighborhood schools. The method to assign the K-5 level students residing in New Columbia to the schools they are predicted to attend **assumes that 80 percent will attend neighborhood schools**. The remaining 20 percent of K-5 students predicted to reside in New Columbia are assigned to PPS schools outside the neighborhood based on the historical percentages of PPS students residing in the entire attendance areas of Ball and Clarendon that attended other PPS schools. The method of assigning the students to the PPS schools utilizing the allocation ratios (the percentage of students residing in each ESAA that attend particular PPS schools) is typically used for all areas throughout the District when forecasting the number of students attending each PPS school. The PPS students in grades 6-8 and 9-12 residing in New Columbia are predicted to attend neighborhood schools at similar percentages as in the past which is approximately 70 percent and 60 percent respectively.

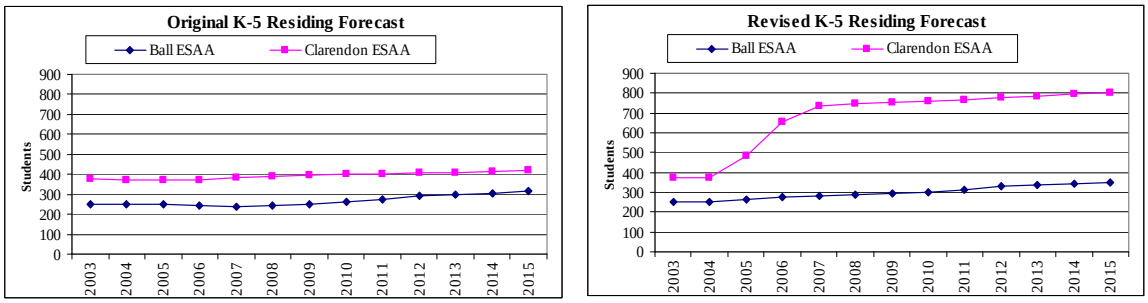

Impact of New Columbia Housing and Revised Forecast

The original 2004-2015 residing forecast for Ball and Clarendon ESAAs accounted for a significant and increasing Hispanic population in both areas and for the higher birth rates and larger family size associated with the Hispanic population group. However, students in grades K-5 residing in Ball ESAA were expected to decrease slightly and then increase later in the forecast period as a result of average grade progression ratios of less than 1 (meaning more students in a particular grade level are residing in Ball one year than are present in the following year in the next highest grade level).

Students in grades K-5 residing in Clarendon ESAA were expected to slightly increase in the original forecast throughout the period because a higher proportion of Hispanic population resides in Clarendon than in Ball, and Clarendon has slightly higher GPRs than Ball.

Most PPS students moving to New Columbia are assumed to be moving from several ESAAs within Roosevelt and Jefferson HSCLs. Under this assumption, the number of PPS students residing in Clarendon ESAA will almost double from 2004 to 2007 and will increase slightly during the remainder of the forecast period. In addition, slight annual increases in the number of students residing in Ball ESAA during the forecast period will be seen.

Figure 6. PPS Students Residing in Ball and Clarendon ESAAs

New Columbia Students Attending Neighborhood Elementary Schools

Because New Columbia will capture almost 20 percent of its PPS students from Ball ESAA and Clarendon ESAAs and most students moving to New Columbia are assumed to reside in the Clarendon ESAA portion, the affect on enrollment in Clarendon Elementary School is much more pronounced than in Ball Elementary School. Enrollments predicted for Ball Elementary School in the revised forecast are higher than in the original forecast; enrollments increase instead of decrease from 2003 to 2007, but the increase is no more than 15 additional students per year. Clarendon Elementary School's enrollment is expected to increase greatly. The New Columbia housing development is expected to increase Ball's enrollment by about 35 students in 2007 and Clarendon's enrollment by almost 300. See Table 15 below.

Table 15. K-5 Enrollment in Ball an Clarendon Elementary Schools, Difference between Original and Revised Forecast

Enrollment	Actual 2003	Original 2005	Original 2006	Original 2007	Revised 2005	Revised 2006	Revised 2007

Change of K-5 Enrollment			**Original Change 2003-2007**	**Original Change 2003-2007 %**		**Revised Change 2003-2007**	**Revised Change 2003-2007 %**
Ball			-6	-2.7%		34	15.0%
Clarendon			5	1.5%		297	87.9%
Total			-1	-0.2%		331	58.7%

The pattern of original and revised enrollment growth throughout the forecast period for each of these schools is seen in Figures 7 and 8 below.

Figure 7. Original Enrollment Forecast

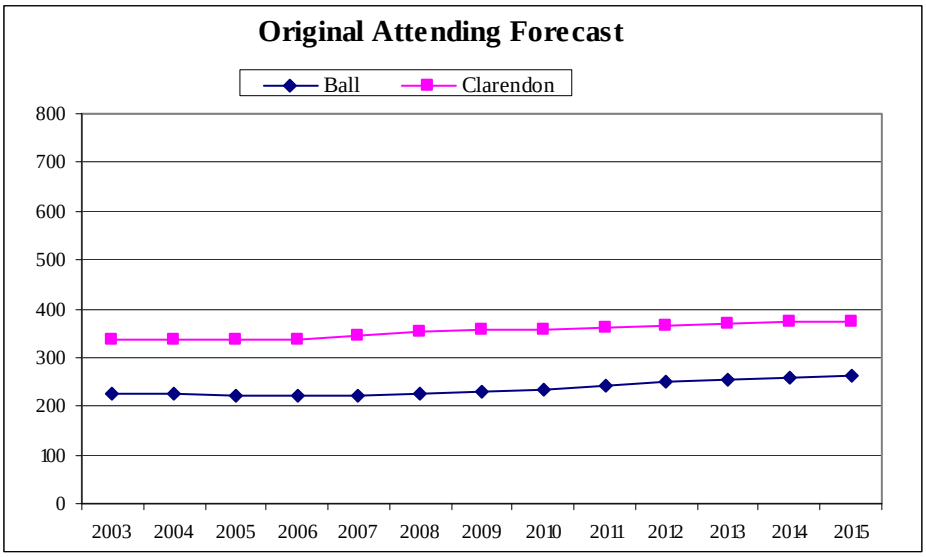

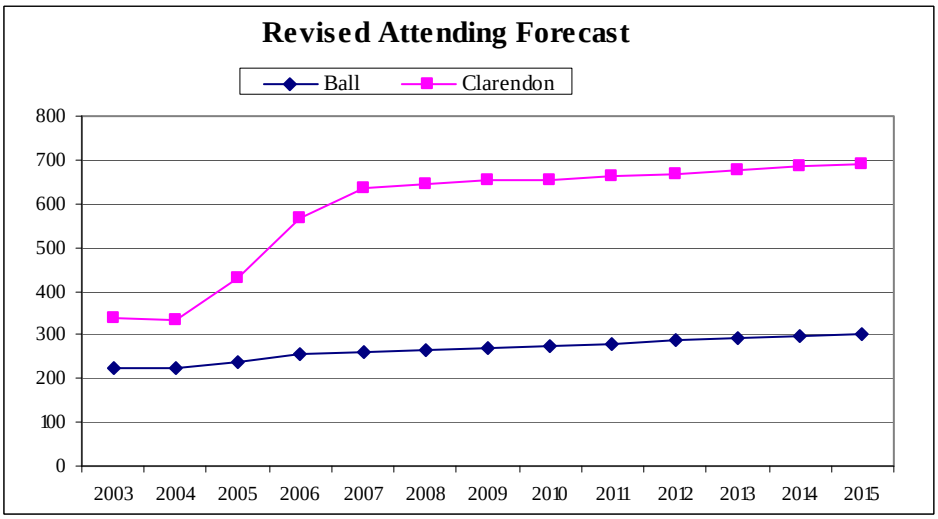

Figure 8. Enrollment Forecast after New Columbia Housing Study

Impact of Forest Park and New Columbia Housing Growth on District-wide Enrollments

Because the new students moving to New Columbia are assumed to already be attending PPS schools, the only aggregate affect on the District-wide enrollments in the revised forecasts is from the changes in Forest Park ESAA. The effect on district-wide enrollments is essentially the same as the effect in Forest Park. Minimal impact on the district-wide enrollments is foreseen throughout the forecast period, however fewer elementary school students and more high school students are projected to be attending PPS schools (see Table 17 below).

Impact of Forest Park and New Columbia Housing Growth on Enrollments in Individual Schools

The enrollment forecasts for elementary schools with an enrollment change of over 3 percent sometime during the forecast period due to the revision are listed in the table below. The elementary schools most affected by the changes in the revised enrollment forecast are located in the Roosevelt and Jefferson ESAAs. Enrollments in Portsmouth Middle School in Roosevelt HSCL, and Roosevelt High School are the most affected secondary schools by the forecast revision. Enrollments in both schools are predicted to be higher than in the original forecast. Slightly higher enrollments inWest Sylvan Middle School and Lincoln High Schools are also predicted in the revised forecast. The enrollments in the remaining middle and high schools are all slightly lower than in the original forecast. The difference between 2007 enrollments is shown for the schools impacted the most from the forecast revision in Tables 18 below.
